NEKTON-R-Beta

Pet feed supplement to intensify color for salmon-colored areas in the feathers

NEKTON® 1978 PRODUKTE ...tierisch gut!

NEKTON-R-Beta a pet feed supplement that was specially developed to intensify color for salmon-colored areas in the feathers, **NEKTON-R-Beta** prevents feather colors from fading and positively influences the natural shine and brightness of the whole plumage.

NEKTON-R-Beta can help to support the bird's health in a natural way during the molting period.

In order to increase the quality of **NEKTON-R-Beta**, we focused on great value natural components.

NEKTON-R-Beta contains pure brewer's yeast & yeast cell walls and combines the advantages of the prebiotic and immune-stimulating effects of yeast cell walls with valuable nutrients of brewer's yeast.

Brewer's yeast has a combination of health-promoting nutrients and active ingredients, which have a positive effect on the bird's organism.

These include essential amino acids (such as methionine, which is particularly important for birds), B vitamins, various minerals, trace elements and enzymes.

Brewer's yeast also contains proteins with a complete amino acid profile. These are important components for new plumage and are increasingly needed during molting. Brewer's yeast can strengthen the bird's immune system and can help support the intestinal flora.

In addition to brewer's yeast, **NEKTON-R-Beta** contains brewer's yeast cell walls, which consist of mannan oligosaccharides (MOS) and ß-glucans. These ingredients can have prebiotic effects on the beneficial microflora of the intestine and can naturally promote a balanced intestinal flora.

The need for individual amino acids during the moult is particularly high. An insufficient supply of the bird with amino acids can lead to a delayed change of feathers as well as disturbances of the feather morphology (such as, for example, curved or very soft feathers). **NEKTON-Orange** contains 18 amino acids, which can support the formation of new plumage during the strenuous moulting period.

A daily diet must contain sufficient vitamins, minerals and trace elements for a functioning metabolism and therefore a combination of **NEKTON-R-Beta** with **NEKTON-Biotin** or **NEKTON-S** is recommended.

NEKTON-R-Beta contains a high amount of the highly effective colorant beta carotene, which is found in nature.

NEKTON-R-Beta is administered in the drinking water or soft feed at the beginning of molting/rearing until the end of molting or as soon as the bird's color is fully restored.

Contains 18 amino acids
Statement of Ingredients: Dextrose, brewer's yeast, brewer's yeast cell walls (contains mannanoligosaccharides and ß-glucans)
Sensorial additive: Dye

Also in our assortment:

NEKTON-R
Pet feed supplement to intensify color for **red areas** in the feathers

NEKTON-Gelb
Pet feed supplement to intensify color for **yellow areas** in the feathers

NEKTON-Orange
Pet feed supplement to intensify color for **orange areas** in the feathers

Available in sizes: 35 g, 150 g

Feeding recommendation:
This depends on the desired intensity of the colouring. 1 g (one level NEKTON-spoon) sufficient for 10 canaries in 250 ml drinking water or in 100 g soft food. Apply only during the plumage growth.
